# SEARCHLIGHT
SERVICES

@
<meta>

Since 1998 Searchlight has delivered technology-centered services for evidence collection, review and production to legal professionals.

INNOVATION

Searchlight™ eDISCOVERY services enable clients to collect, search, and review evidentiary material and generate document productions. The company can collect data from a wide array of hardware including desktops, laptops, handheld devices, servers, backup tapes and more. Once collected the data can be culled, searched and reviewed using the most advanced imaging and searching technologies.

The Searchlight process captures all related metadata, sets aside all system files using the NSRL, sets aside duplicates using the most current hashing techniques, culls the data set using the most advanced searching tools and supports a native file review to expedite the review process and reduce production costs.

NATIVE FILE REVIEW

Clients review documents in their native format without altering associated metadata and without the native application loaded. And, they search their documents using keywords and concepts developed in their natural language. This process dramatically reduces their review time and production costs.

FORENSIC SERVICES

In addition to data collection services, Searchlight offers a range of forensics services including making imaged copies of damaged drives and the recovery of deleted and hidden files.

FEATURESANDBENEFITS

- Fully automated
